THE COUNCIL FOR TOBACCO RESEARCH - U.S.A.

CONFIDENTIAL

February 8, 1966

MEMORANDUM

TO: The committee comprising Dr. Reimann, Dr. Andervont and Dr. Little.

FROM: Vincent F. Lisanti

SUBJECT: Proposal from Dr. J. Manhold, D.M.D. - No. 529.

Dr. John Manhold of the New Jersey State Dental School has submitted a modest proposal which is estimated at eighteen months duration. His oral pathology service and register will provide source material for information needed by the health professions.

This proposal should be considered a pilot or feasibility study at two levels:

A. To relate the frequency of aberrant growths to smoking histories from material available and to extend this type of related study with biopsy material as it comes into his laboratory on a current basis.

B. To evaluate gingival biopsy tissues from a respirometric point of view in both smokers and non-smokers.

This can become another component area of interest in our Oral Research Program. Outside consultative opinion is very favorably inclined both in need of this study and the qualifications of Dr. Manhold to do a serious thorough investigation.

Vincent F. Lisanti
